

Python on a Symbian-based Nokia S60 smartphone

Written by Tim Black

Over Thanksgiving I wrote a [little program](#) in JavaScript for my Dad, who is a charter pilot who needs an easy way to record several time values with the press of one button on his smart phone:

- engine start
- takeoff
- landing
- engine shutdown

It works great, except Opera doesn't allow files opened from the local filesystem to store cookies, and Dad doesn't always have web access when he needs to record a time value. (Maybe I should try an Opera Widget...) So, in the spirit of the Do-It-Yourself books he's got on his bookshelf, over Christmas Dad asked me what language I'd recommend he use to write a program for his phone.

If I knew how to use Google Gears on the Nokia S60, maybe I'd recommend it. But I don't and I wonder if Gears is still too new. So after a little research, here's what I came up with:

It looks to me like [C++](#) is the default language to use on Symbian, and Java is a close second. However, I wouldn't use either myself, because the syntax of both [C++](#) and

[Java](#)

(see

[Executive Summary](#)

,

[short code comparison](#)

and

[long code comparison](#)

) (and development process--you have to compile for your particular operating system before you run) is

[more complex](#)

than Python's (and I already use Python), and Python

[works on Symbian](#)

. It is my impression that Python programs are also more portable to other operating systems than are C++ programs. For these reasons, it looks like

[Symbian development](#)

is

[moving toward](#)

using Python and Ruby. There are several Python libraries available that you can "import" into your Python code to create the application's GUI features (title, menu, central content including buttons, text boxes, pictures, etc.). They work by providing a Python interface to Symbian's software development kits -

[SDK](#)

s (see

[S60 SDKs](#)

) including Symbian's

graphical user interface (GUI) libraries and other available functionality (contacts, calendar, filesystem, phone, etc.).

I'd also consider using an integrated development environment (IDE) specifically designed for creating GUI programs on Symbian, because an IDE can give you a layout editor that lets you create the program by dragging and dropping GUI widgets (buttons, text boxes, etc.) into your program and then writing code to respond to widget events (mouse clicks, character presses, etc.). One Symbian C++ IDE is [Carbide](#), a set of extensions to the [Eclipse](#) IDE. It appears there isn't a Symbian GUI IDE yet for Python or Ruby.

So to summarize, here's what I would use, in the order they would need to be installed on your computer:

Python interpreter

Use the latest version of [Python 2.5](#), unless you find that the other tools below are only compatible with an earlier version of Python, in which case, install the earlier version.

SDK A package containing a Python interface to a Symbian SDK and related tools:

[PyS60](#) (seems to be the [best](#) & most current) [Python for S60](#) seems to be an older version of the same, see its helpful [w](#)

[iki](#)

[Python for UIQ](#) (out of date)

IDE

Simple: [IDLE](#), which comes with Python & is included in PyS60

More full-featured: [Boa Constructor](#) (requires [wxPython](#)) (I recommend installing [TortoiseC](#)
[VS](#) first to

[install the most recent version](#)

of Boa Constructor)

Book

If one exists, it's a good idea to use a book as a guide to how to program on the S60 in your chosen language. The only one I can find for Python is [Mobile Python](#), and it looks to be exactly what you would want. I might start with the [author's tutorial](#) instead.

Other stuff

[Code snippets](#)

Here are some tools for making it easier to test your Python code on the phone: <http://people.csail.mit.edu/kapu/symbian/python.html>
